

Alternative starting point of the zodiac

Enigma Factsheet · Alternative starting point of the zodiac

A tropical zodiac begins at the intersection of the equator and the ecliptic: 0° Aries, also known as the vernal point. A sidereal zodiac uses other starting points, indicated by the ayanamsa. You can also choose other starting points for the zodiac and thus define a relative zodiac with respect to, for example, a planet.

Draconic Zodiac

The most commonly used form of a relative zodiac is the Draconic Zodiac. It begins at the North Lunar Node.

Although the lunar nodes were already important in the earliest forms of astrology, there is no evidence that a Draconic Zodiac was used in earlier times.

This approach only attracted attention following a publication by Maurice Froger in 1959.

Other starting points

You can have a zodiac begin from any factor. A relative zodiac calculated in this way is purely experimental.
