

Venus Star Point

Enigma Factsheet · Venus Star Point

The Venus Star Point (VSP) shows the conjunctions between Venus and the Sun before and after birth. This technique was introduced by Arielle Guttman.

A pentagram

Successive conjunctions between Venus and the Sun show a remarkable regularity. The mutual distance is approximately 72 degrees. If you know a conjunction of Sun and Venus, you may assume that the next conjunction falls approximately 72 degrees earlier in the zodiac — that is, in the retrograde direction.

Due to this phenomenon, the successive conjunctions form a pentagram figure.

Types of conjunctions

There are two types of conjunctions: inferior and superior. We speak of an inferior conjunction when Venus is positioned between the Earth and the Sun. A superior conjunction means that Venus, as seen from Earth, is behind the Sun.

Usage

The points formed by the VSP technique can be used for timing and for interpretation.
