

# The composite

---

Enigma Factsheet · Composite

*The composite was introduced by John Townley. It is a constructed chart for two partners or for a larger group of people. You use a composite for romantic partners, but also, for example, for friendships or business contacts.*

## The basic idea of the composite

You calculate a composite by determining, for each factor, its position in the charts of both partners and then calculating the midpoint of the two. When you calculate a composite for more than two people, you calculate the average position.

You can also use a variant in which you still determine the midpoint of the MC but also take into account the location where the relationship takes place. Based on the MC found in this way, you then calculate the cusps for that location.

## Not a real chart

In practice, a composite will not actually occur in reality; it is a construction and not a real chart. You can even end up with impossible positions, for example an opposition between the Sun and Venus.

The cusps, too, usually do not match cusps that occur in reality. Only with equal houses will you not notice this.

## Progressions

Because a composite is not a real chart, you cannot use most progression systems. After all, there is no start date for a composite.

Transits, however, can be applied. Enigma does not support this option.
