

Waves

In 1986, Dutch astrologer Robert Doolaard introduced his theory about Waves.

It concerns a cyclical representation of the distances between planets. A distinction is made between three types of waves: Jupiter, Saturn and Uranus.

The principle

For the Jupiter wave, you calculate the combined distances between pairs of planets. For the Jupiter wave, these are all possible pairs from Jupiter through Pluto. For the Saturn wave from Saturn through Pluto, and for the Uranus wave from Uranus through Pluto. See the table.

The distances are always calculated over the shortest arc and can therefore never exceed 180 degrees per distance.

PAIR	JUPITER WAVE	SATURN WAVE	URANUS WAVE
Jupiter/Saturn	x	-	-
Jupiter/Uranus	x	-	-
Jupiter/Neptune	x	-	-
Jupiter/Pluto	x	-	-
Saturn/Uranus	x	x	-
Saturn/Neptune	x	x	-
Saturn/Pluto	x	x	-
Uranus/Neptune	x	x	x
Uranus/Pluto	x	x	x
Neptune/Pluto	x	x	x

Meaning

A high value for the combined results of Jupiter, Saturn and Uranus indicates favourable historical developments, while a low value indicates less favourable historical developments.

Special situations

It can happen that a wave remains at a fixed value for an extended period. This applies in particular to the Uranus wave which, for example in the middle of this century, remains at 360 degrees for over 30 years. This occurs with certain distances: when the movement of a planet causes one of the distances to increase by one degree, another distance will decrease by one degree.
